

iDeliver III

Development Session Log & Change Archive

Session date: 1 June 2026 • Version 3.0.0

Summary

This document archives the features and changes implemented during the development session. Work focused on the Orders, Customers, Payments, Drivers and order-closing workflows. Every change was verified against the running application, and any temporary test data created during verification was reverted.

Features delivered

1. Smart customer selection in the order form

- Type-ahead combobox that searches existing customers (name / mobile) with an inline dropdown.
- Full searchable customer picker via the search button.
- Detects a name that isn't an existing customer and offers a "do you want to save?" hint.
- Quick **New Customer** modal (pre-filled) that, on save, auto-fills the order's customer fields (name, mobile, WhatsApp, address).

2. Payments & money collection

- Multiple payments per order — method, amount, **currency (USD / LBP)**, date, notes; add / edit / delete.
- **Per-currency Payment Summary**: Total Order, Total Paid, Total Pending.
- Derived payment state (Unpaid / Partial / Paid) and a "Collection from customer" indicator (Money is due / partially collected / fully collected).
- Stored in the existing `payment_collections` table.

3. Customer account numbers

- System-generated **12-digit account number** (displayed as `0000 0000 0000`), generated client-side as the highest existing number + 1.
- Shown read-only in the customer form (Contacts page and the order-form quick-add) and in the customers list.
- Also shown **under the customer name in the orders list**.
- Audit stamping: `branch_id` + `created_by` on creation, `updated_by` + `updated_at` on edit (from the signed-in user).

4. Order & delivery statuses

- **Order status** lifecycle: Scheduled → Confirmed → In Progress → Completed (mapped to the database `status` enum on save).
- **Delivery status**: Awaiting Pickup → Picked Up → In Transit → Delivered.
- **Collection from customer** derived automatically from payments.

5. Closing & locking orders

- **Mark Closed** button — enabled only when fully paid (no pending), Completed and Delivered.
- Sets `isclosed = true` (plus `closed_at` / `closed_by`).
- Closed orders are **locked**: read-only form, no edit, cancel or delete; quick actions disabled.

6. Orders list — filtering & pendings

- Filter by **driver**, **customer**, and **scheduled date** (single day or a date range), in addition to search and status.
- **Display Pendings** popup: per-currency Total Orders / Total Paid / Total Pending across the currently filtered orders.

7. Orders list — quick actions

- **Quick driver assign**: a button on each row opens a searchable driver list; click to assign instantly.
- **Quick status change**: click the status badge to pick a new status from an option menu.
- Both are disabled once the order is closed.

8. Driver duty status (Drivers list)

- Gated by `driver_on_duty` : if not on duty → **Out of duty**.
- **On Duty** — has an assigned order happening now (today, within the pickup→delivery window) with delivery status Picked Up or In Transit.
- **Scheduled** — has an assigned order whose start time hasn't arrived yet (shows date & time).
- **Available** — on duty with nothing active or upcoming.

Files changed

File	Purpose
<code>src/pages/DeliveriesPage.jsx</code>	Orders: customer combobox, payments, statuses, filters, Display Pendings, quick actions, Mark Closed / locking, account number in list.
<code>src/pages/ContactsPage.jsx</code>	Customer account number field + audit/branch stamping.
<code>src/pages/DriversPage.jsx</code>	Driver duty-status logic (On Duty / Scheduled / Available / Out of duty).
<code>src/components/ui/Badge.jsx</code>	Status badge labels & colors (Scheduled / In Progress / Completed / Paid).
<code>src/context/AppContext.jsx</code>	Orders query now includes the customer's account number.
<code>src/lib/accountNumber.js</code>	New helper: generate & format customer account numbers.
<code>supabase-fix10.sql</code>	Optional unique index on <code>account_number</code> .

Database columns used / added

Table	Column	Use
contacts	<code>account_number</code>	12-digit customer account number (text).
contacts	<code>branch_id</code> , <code>created_by</code> , <code>updated_by</code> , <code>updated_at</code>	Audit / branch stamping.
contacts	<code>driver_on_duty</code>	Driver attendance flag (set by external app).
delivery_orders	<code>delivery_status</code>	Goods progress (Awaiting Pickup ... Delivered).
delivery_orders	<code>collection_from_customer</code>	Derived money-collection state.
delivery_orders	<code>isclosed</code> , <code>closed_at</code> , <code>closed_by</code>	Order close / lock.

delivery_orders	status, collected_usd, collected_lbp	Lifecycle status & collected amounts.
payment_collections	amount_usd, amount_lbp, collection_type, ...	Order payments.

Open items & notes

- **Order status** is stored by mapping the four labels to the existing `status` enum (Scheduled→pending, Confirmed→confirmed, In Progress→in_transit, Completed→delivered). To store the literal values instead, the enum can be extended.
- **EUR payments:** `payment_collections` stores USD / LBP only; EUR order totals appear in summaries but EUR payments cannot be recorded without a schema change.
- **Drivers:** the status filter tabs still use the old `driver_status` enum, which no longer matches the new derived display — can be aligned on request.
- **driver_on_duty** is expected to be maintained by the external attendance application (true when on duty, false/empty when off).

iDeliver III — Development Session Log. Records work completed and verified on 1 June 2026. Generated automatically from the application project. Companion documents: iDeliver-III-Capabilities.pdf and iDeliver-III-User-Manual.pdf.
