

iDeliver III

Delivery & Logistics Management — Desktop Application

Application Capabilities Overview

Generated 31 May 2026 • Version 3.0.0

1. Overview

iDeliver III is a desktop application for managing delivery and logistics operations: orders, customers, drivers, payments and money collection. It runs as a native desktop app and is backed by a cloud database with live updates, so changes appear across the app in real time.

Desktop app (Electron)

React user interface

Supabase / PostgreSQL backend

Real-time sync

Multi-currency (USD / LBP / EUR)

2. Access & Security

- Secure login with username, email, or mobile number and password.
- Session-based access (auto-expires after 12 hours) with user roles.
- Every record created or changed is stamped with the signed-in user and branch (created by / updated by / updated at / branch).

3. Modules

The application is organized into the following areas (left sidebar):

Dashboard

Orders

Drivers

Tracking

Reports

Contacts — Customers / Suppliers / Partners

Products

Purchases

Company

4. Orders & Deliveries

The core of the application. Each order captures the recipient, customer, route, schedule, driver, items, payments and status.

Creating & editing an order

- Recipient details (name, mobile, WhatsApp) and the linked customer.
- Route: pickup / origin and delivery address.
- Schedule: date plus pickup and delivery times, with one-tap –1h / –10 / +10 / +1h adjusters.
- Driver assignment and order status.
- Retail items: multiple line items, each with product, quantity, unit price, currency and discount.
- Delivery fee, discount and VAT, with automatic **per-currency totals**.
- Free-text notes and special instructions.

Smart customer selection

- Type-ahead combobox that searches existing customers as you type (name or mobile).
- A full searchable customer picker is also available via the search button.
- If the typed name is not an existing customer, a hint appears: *"It seems this is a new customer — do you want to save?"*
- One click opens a **quick New Customer form** (pre-filled with the typed name and any details already entered). On save, the order's customer fields are filled automatically.
- New customers receive a system-generated **12-digit account number** (shown as 0000 0000 0000).

Payments & money collection

- Record **multiple payments per order** — each with method, amount, currency (USD / LBP), date and notes; payments can be added, edited or deleted.
- **Per-currency Payment Summary** showing, for each currency, Total Order, Total Paid and Total Pending.
- Payment state is derived automatically: **Unpaid**, **Partially paid**, or **Paid**.
- **Collection from customer** indicator: "Money is due", "Money partially collected", or "Money fully collected".

Statuses

Order status

Where the order is in its lifecycle.

- Scheduled
- Confirmed
- In Progress
- Completed

Delivery status

Physical progress of the goods.

- Awaiting Pickup
- Picked Up
- In Transit
- Delivered

Closing & locking an order

- A **Mark Closed** action becomes available only when the order is **fully paid (no pending dues)**, status is **Completed** and delivery is **Delivered**. Until then it stays disabled with a tooltip explaining what is missing.
- Once closed, the order is **locked**: it cannot be edited, cancelled or deleted, and it is clearly marked as Closed in the list.

5. Orders List — Filtering & Quick Actions

- Search by order number, recipient, mobile or address.
- Filter by status, by **driver**, by **customer**, and by **scheduled date** — a single day or a date range.
- **Display Pendings**: a summary popup showing, per currency, Total Orders, Total Paid and Total Pending for the currently filtered orders.
- **Quick driver assign**: a button on each row opens a searchable driver list — pick a driver to assign instantly.
- **Quick status change**: click the status to pick a new one from a small option menu.
- Quick actions are disabled automatically once an order is closed.
- Orders can also be cancelled / reactivated, and the order number copied with one click.

6. Contacts

- Manage Customers, Suppliers and Partners with contact details, location and notes.
- Customers are assigned a unique **12-digit account number** automatically, shown in the form and the list.
- Search and active / inactive filtering.

7. Additional Areas

The application also includes Dashboard, Drivers, Tracking, Reports, Products, Purchases and Company sections that complement the order workflow described above.

iDeliver III — Application Capabilities Overview. This document summarizes functionality available as of 31 May 2026 and focuses on the order, customer, payment and collection workflows. Generated automatically from the application project.
